

ASSESSMENT GUIDE

ITEC631: Information Technology Masters Project Part B, Semester 2, 2026

Assessment Number 2 (A2) Final Project Presentation and Prototype Demonstration

Assessment key details

Assessment classification	Written, Oral, Experiential, Simulations
Assessment method	Group presentation, final prototype demonstration and question-and-answer session
Assessment type	Lane-1 (Secure) and Lane-2 (Open)
Assessment artefact	Presentation slides, final prototype/system, source code and supporting evidence
Collaboration type	Individual contribution and submitted as a Group
Due date:	Week 11/12 - see Canvas for the exact date and time
Weighting:	30
Length and/or format:	Up to 30/40 minutes per group (depending on the size of a class), including demonstration and questions
Learning outcomes assessed	LO2; LO4
Graduate capabilities assessed	GC4, GC5, GC9
How to submit:	Through the Assessment 2 submission area in Canvas
Return of assignment:	Two weeks after submission
Assessment criteria:	Rubric: see the end of this document

Why this assessment?

- Demonstrates the final working prototype.
- Connects requirements, implementation and testing.
- Evaluates usability, challenges and lessons learned.
- Shows SFIA skills and professional readiness.

What are the types of employability skills that I will acquire upon completion of this assessment?

Skill Type	
Developed Work readiness	☒
Developed Knowledge of study areas	☒
Developed Spoken communication	☒
Developed Written communication	☒
Developed Confidence to learn Independently	☒
Developed Teamwork developed	☒
Developed Complex problem solving	☒
Developed Critical thinking skills	☒

Assessment overview:

Purpose:

The purpose of this assessment is to evaluate the final implementation and presentation of your ITEC631 project. Each team must demonstrate a complete working final prototype or system, show how it addresses the approved requirements, and provide evidence of implementation, testing and user evaluation.

The assessment also develops the professional skills needed to communicate technical work to specialist and non-specialist audiences, reflect critically on the project journey, evaluate skills against the SFIA framework, and demonstrates readiness for professional practice.

Context

ITEC631 is the second part of the IT Masters Project and focuses on implementing the project and communicating its results. Assessment 2 is the final group presentation before submission of the project thesis. It brings together the technical work completed across the semester and requires the team to present the most complete and defensible version of its system.

The presentation should provide clear evidence of what the project achieved, how the system was designed and built, how its quality was evaluated, and what the team learned. Any incomplete features or limitations must be identified honestly and explained. The evidence prepared for this assessment should also support the final project thesis.

Instructions

The final presentation will take place in Week 11/12 during the scheduled class. The exact date, time and presentation order will be advised in Canvas. Each team is allocated up to 30/40 minutes (depends on class size), including the live demonstration and questions.

All team members must attend, contribute meaningfully and be prepared to explain both their own work and the overall project. Questions may be directed to individual members. Individual marks may be adjusted where there is clear evidence of unequal contribution.

What to cover in the final presentation

- A concise overview of the project problem, intended users, final scope and expected value.
- The final approved functional requirements, including any changes made since Assessment 1 (sprints) and the reasons for those changes.
- The final system architecture and the main client, server, database, service and external components, where relevant.
- A live demonstration of the final working prototype or system, covering the main user roles and the most important end-to-end workflows.
- A clear explanation of the technical skills demonstrated, including relevant languages, frameworks, databases, APIs, tools, version control, deployment or configuration practices.
- Evidence that the implemented features satisfy the approved requirements and acceptance criteria.
- The testing stages used, test evidence, defects identified, corrections made and any remaining quality risks.
- The techniques used to evaluate the user interface, such as user feedback, usability testing, heuristic evaluation, accessibility review or another suitable method.
- Important implementation or integration problems, how the team investigated them, the decisions made and the lessons learned.
- Relevant ethical, privacy, security, accessibility and common-good considerations, including how these influenced the final system.
- The team's major achievements, comparison with the project plan, limitations, incomplete work and realistic recommendations for future development.
- The skills developed by each team member, supported by evidence and mapped to relevant areas of the SFIA framework, together with a reflection on professional readiness.

Final prototype and demonstration expectations

The prototype demonstration is a central part of this assessment. It should show the system operating as a coherent product rather than a collection of unrelated screens or code fragments.

- Demonstrate the main workflow from beginning to end and include all important user roles relevant to the project.
- Show successful use as well as at least one error, validation, security or boundary case. Use safe test data and do not display confidential or personal information.

The version demonstrated must match the submitted code. Prepare a short backup video or clear screenshots in case an unexpected technical problem prevents the live demonstration.

Presentation, contribution and evidence requirements

- Each member should lead part of the presentation or demonstration and clearly identify their contribution to the project.
- Explain important design and implementation decisions rather than only showing the finished screens.
- Support claims with evidence such as requirement traceability, test results, user-evaluation findings, repository history, diagrams or issue records.

- Identify limitations and incomplete features honestly. Explain their effect on the project and how they could be addressed in future work.
- Use a small number of clear, professional slides. The slides should guide the presentation and support the demonstration, not replace it.
- Do not read directly from the slides. Be prepared to respond to technical and non-technical questions and demonstrate ownership of the work.

Process for completing the assessment

1. Confirm the final project scope and review the approved requirements, Assessment 1 feedback, project plan and outstanding backlog items.
2. Agree on the final features that can be completed, integrated, tested and demonstrated reliably within the available time.
3. Complete the implementation and integration of the main components, and conduct a team code review or equivalent quality check.
4. Test the final system against the requirements and acceptance criteria, recording test cases, results, defects and corrections.
5. Evaluate the user interface using an appropriate method and summarise what was learned and what was improved.
6. Review security, privacy, accessibility, performance, reliability and deployment considerations that are relevant to the project.
7. Prepare evidence of individual and team contributions (including peer feedback), including version-control records, sprint records, issue tracking or other suitable project evidence.
8. Map the skills developed through the project to relevant SFIA skills and prepare specific examples that demonstrate those capabilities.
9. Prepare the slides, final demonstration sequence and backup demonstration material. Rehearse the presentation as a team and check the timing.
10. Submit all required files through Canvas before the deadline and retain a complete backup of the code, documentation and presentation material.

Suggested presentation structure

Part	Suggested focus	What to show
1	Project overview and final scope	Problem, users, objectives, common good and final approved scope
2	Requirements and architecture	Requirement coverage, changes, architecture and key design decisions
3	Final prototype demonstration	Main workflows, user roles, successful cases and error or boundary cases
4	Implementation and technical skills	Technologies, integration, version control, deployment and important decisions
5	Testing and quality	Testing stages, results, defects, corrections, security and reliability evidence
6	User interface evaluation	Usability or user feedback method, findings, accessibility and improvements
7	Project journey and professional skills	Challenges, achievements, lessons, contribution evidence and SFIA mapping

Part	Suggested focus	What to show
8	Limitations and next steps	Remaining limitations, future improvements and preparation for the final thesis

How do I submit?

- Upload the presentation slides in PowerPoint or PDF format to the Assessment 2 submission area in Canvas before the deadline.
- Upload the final source code as a compressed project folder or repository export, together with a README that explains setup, dependencies, test accounts and how to run the system.
- Upload a short backup demonstration video if requested in Canvas. The video is a contingency only and does not replace the live presentation unless prior approval has been given.
- Only one member needs to upload the group files unless otherwise advised, but all members are responsible for checking that the correct and complete files have been submitted. Use clear file names, such as ITEC631_AT2_TeamName_Slides and ITEC631_AT2_TeamName_Code.zip.
- Remove passwords, API keys, confidential information and unnecessary personal data before submission. Keep a backup copy of all files, repository history, test evidence and demonstration materials.

Student submission checklist

Before submitting, our team has checked that:	Done
The final scope and completed requirements are clearly identified.	☐
The final prototype has been tested and the live demonstration has been rehearsed.	☐
The demonstration includes the main workflows, relevant user roles and at least one error or boundary case.	☐
Testing and user-interface evaluation are supported by evidence.	☐
Implementation decisions, challenges, limitations and future improvements are explained honestly.	☐
Each team member has a clear presentation role and can explain their contribution and the overall system.	☐
SFIA skills are supported by specific evidence from the project.	☐
The submitted code matches the demonstrated version and includes a clear README.	☐
External sources, code, images, datasets and AI assistance have been acknowledged where required.	☐
Passwords, API keys and confidential data have been removed, and the team has retained a complete backup.	☐

Helpful resources

- The ITEC631 weekly discussion slides and workshop materials in Canvas.
- The approved requirements, architecture, design models and project plan from ITEC630 and ITEC631.
- Assessment 1 feedback, sprint records, version-control history, issue tracker and test evidence.
- The SFIA framework and the skills evidence developed by each team member.
- ACU Academic Skills Unit resources for oral presentations, academic communication and reflective writing.

Who can help me?

- Ask project and assessment questions during the weekly workshop or consultation time.
- Post general questions in the ITEC631 Canvas discussion forum so that all students can benefit from the response.
- Contact the Lecturer in Charge (walayathussain@acu.edu.au) for matters that are confidential or specific to your team. walayathussain@acu.edu.au
- Use the Academic Skills Unit for support with presentation structure, communication and academic writing.

I am having problems

Tell the Lecturer in Charge as early as possible if a technical, team or project issue is likely to affect the final presentation. Do not wait until the presentation day to report a problem that has been developing over several weeks.

This is a group and in-class assessment activity, so the automatic 72-hour extension may not apply. Check the current information in Canvas and ACU policy. If your studies are affected by unforeseen or exceptional circumstances, follow the Special Consideration process and provide the required documentation. Contact the Lecturer in Charge if you are unsure about the appropriate process.

Special Considerations

Refer to the Special Consideration procedure if your studies have been affected by unforeseen or exceptional circumstances and you are seeking exemption from academic penalty. [Special Consideration procedure](#)

Complete a Special Consideration application if: [Special Consideration application](#)

- you were unable to apply for an extension before the due date/time, and
- you have valid supporting reasons and documentation.

Special Consideration is different from the automatic three-day extension and is typically used for more significant or unexpected circumstances.

Referencing

Use IEEE referencing where external sources are included. This applies to borrowed diagrams, images, definitions, code, libraries, frameworks, datasets and other material that is not the team's own work. Include brief citations on the relevant slide and a reference list at the end of the presentation.

Academic integrity

Submit only work produced by your team and acknowledge the work of others. Copying code, diagrams, written material or project artefacts without appropriate acknowledgement may constitute academic misconduct. Each student must be able to explain the work attributed to them and demonstrate an understanding of the submitted system.

Please refer to the [Academic Integrity and Misconduct Policy and the Academic Misconduct Procedures](#) for full details. In particular, academic misconduct, including cheating, plagiarism, collusion, recycling of assignments, and misrepresentation, is not acceptable. Penalties for academic misconduct may vary in severity and can include exclusion from the course.

ACU takes academic misconduct very seriously. To ensure all students prepare their work with integrity, the LIC will contact you and ask you to explain your work and how you prepared it, should they suspect that academic misconduct may have occurred.

Use of generative AI

Generative AI tools may be used in a limited and transparent way to support learning and development. Appropriate uses may include brainstorming, explaining concepts, identifying possible coding errors, suggesting test cases, improving wording, or reviewing the clarity of documentation.

AI output must not replace the team's own analysis, design decisions, implementation and understanding. Students remain responsible for checking the accuracy, security, privacy, licensing and suitability of any AI-assisted output. Do not enter confidential project, client or personal data into a public AI system.

AI disclosure requirements

Upload the AI disclosure form signed by all team members.

- State whether AI tools were used.
- Name the tool and explain the purpose for which it was used.
- Identify the slides, code or project artefacts that were influenced by AI assistance.
- Explain how the output was checked, changed and integrated by the team.
- Keep relevant prompts and outputs. These may be requested if clarification is required.
- Be prepared to explain any AI-assisted code or content during the presentation and questions.

Important:

Submitting a polished demonstration is not enough if the team cannot explain how the system works, how it was tested, and what each member contributed.

Seeking clarification

If you are unsure whether using an AI tool for a particular purpose is acceptable, contact the Lecturer in Charge at [walayat.hussain@acu.edu.au](mailto:walayathussain@acu.edu.au) before using it. Asking early is the best way to avoid problems later.

Rubric criteria

The full details of the rubric criteria can be found on the following page.

Optional student self-assessment and feedback request proforma

All students will receive feedback on this assessment based on the rubric. If your team would like specific additional feedback, complete the following table and submit it with the presentation materials. Focus on feedback that will help you strengthen the final project thesis.

Questions	Reference Criterion	Team's Response
What is the strongest evidence that the final prototype meets the project requirements?		
Which part of the presentation or demonstration needs the most improvement?		
What specific feedback would help strengthen the final project thesis?		
How did the team act on feedback received in Assessment 1 and later sprint reviews?		

Feed Forward Template: Using feedback to improve the final thesis

Feedback is an important part of the project. Consider the feedback received in Assessment 1 and during the semester, explain how the team acted on it, and identify any feedback from this presentation that should be addressed in the final thesis.

https://acu.qualtrics.com/jfe/form/SV_6QBbEb9U45gfUdU

Example Questions	Feedback recommendation (what we learned from feedback and how we used it)
1. 1. How did the team act on feedback from Assessment 1 and the sprint reviews to improve the final system?	Identify the feedback, the action taken and the evidence that the change improved the project.
2. 2. What feedback from Assessment 2 would be most useful for completing the final project thesis?	Identify the thesis sections or project evidence for which the team needs specific guidance.
3. 3. Did the team have difficulty understanding or applying any earlier feedback?	Describe the point that was unclear and the clarification or support that would help.

Rubric: Assessment 2 - Final Project Presentation and Prototype Demonstration (30%)

Criterion	Marks	Below expectations	Meets expectations	Credit	Distinction	High Distinction
		NN 0-49%	PA 50-64%	CR 65-74%	DI 75-84%	HD 85-100%
1. Final prototype implementation and requirements coverage GC4 / LO2	12	The prototype is substantially incomplete, unreliable or difficult to demonstrate. Core requirements are not addressed, and implementation decisions cannot be explained.	A basic prototype is demonstrated and some core requirements are addressed. Integration, reliability or technical explanation is limited.	A coherent working prototype addresses most important requirements. The system is suitably integrated, and the team explains the main implementation decisions.	A well-integrated and reliable prototype addresses nearly all approved requirements. Technical choices are justified and the system demonstrates strong professional quality.	A polished, substantial and robust prototype convincingly satisfies the approved scope. The implementation shows excellent integration, technical depth and well-justified decisions.
2. Testing, user evaluation and technical judgement GC4 / LO2	8	Testing evidence is absent or inadequate. User-interface evaluation is not demonstrated, and technical problems or limitations are poorly analysed.	Basic testing and limited evaluation evidence are provided. Some defects, user issues or technical decisions are identified but not examined in depth.	Appropriate testing stages, results, defects and corrections are presented. The team provides a credible user-interface evaluation and explains important technical issues.	Testing is systematic and includes meaningful normal, error and boundary cases. User evaluation is well designed, and technical decisions, risks and limitations are analysed thoughtfully.	Quality assurance is rigorous, traceable and well evidenced. The team demonstrates mature judgement about usability, reliability, security, privacy, accessibility and remaining limitations.
3. Critical reflection, SFIA skills and professional readiness GC4 / GC5 / LO2	5	Reflection is superficial. Achievements, challenges, contributions and SFIA skills are unclear or unsupported.	Provides a basic account of achievements, challenges and skills, with limited evidence or connection to professional readiness.	Provides a clear reflection supported by examples, identifies relevant SFIA skills, and explains individual and team learning.	Provides a thoughtful critical reflection on decisions, challenges, lessons and contributions, supported by strong SFIA evidence and a realistic assessment of professional readiness.	Provides an insightful and evidence-based reflection showing mature professional judgement, clear ownership of learning and a convincing understanding of how project capabilities transfer to future practice.
4. Oral communication, live demonstration, teamwork and response to questions GC5 / GC9 / LO4	5	The presentation is unclear, poorly timed or dominated by one member. The demonstration is ineffective, and the team has difficulty answering questions or explaining the work.	The presentation and demonstration are understandable. Most members contribute and provide adequate answers, although organisation, timing or ownership may be uneven.	The presentation is clear and organised, the live demonstration supports the main claims, all members contribute, and questions are answered competently for specialist and non-specialist audiences.	The team communicates confidently and professionally, uses the demonstration and evidence effectively, and provides thoughtful answers that show strong ownership of the project.	The presentation is highly coherent, engaging and precise. The demonstration is seamless, participation is balanced, and responses demonstrate deep understanding, adaptability and exemplary teamwork.
